AI CHAT SUMMARY

For your Unity 6 (URP) university LEGO zoo project, I wrote an Editor script, `LegoEnvironmentBuilder.cs`, which adds the menu option Tools → LEGO Zoo → Build Empty LEGO Environment. It generates only an empty starting environment, with no zoo content: a green 64×64-stud baseplate whose top sits at Y = 0, reusable brick and plate prefabs built from cube bodies and cylinder studs, 13 glossy plastic LEGO materials, a sun with soft shadows, an angled overview camera, grid snapping, and a tidy Hierarchy with a protected `Build Area` for your own work, all at real LEGO proportions ×100 (1 stud = 0.8, brick = 0.96, plate = 0.32). We then went through the script step by step in simple terms, discussed why an Editor script beats building by hand (thousands of studs, exact measurements, easy changes, matching results across your group, safe rebuilds and better performance, while unique creative pieces are still best modelled by hand), and covered how to add your own structures: place prefabs inside `Build Area`, Ctrl-drag to snap to studs, stack at multiples of 0.96 and 0.32, duplicate, recolour and group pieces, save finished structures as prefabs, and import Blender models at the matching scale with the pivot at the bottom corner.
